

Environmental Policy

Optimarin's vision is to be a leading provider of BWTS and leverage our technology and know-how to develop applications to protect marine life. Our aim is to protect the marine environment through innovation, meeting our customer's demand with cost efficient solutions and contributing to the development of our industry.

It is Optimarin's policy through the sale and subsequent use of BWTS to contribute towards improving the environment by cleaning the oceans by reducing the spread of invasive species.

It is further our policy to reduce our environmental footprint by reducing the transportation related to parts and delivery of systems by optimising the supply chain, and recycle as much used material as possible using an approved or well reputed company, and to encourage our suppliers to do the same.

Optimarin manages and monitors all the company's activities which may have an influence on the external environment and aims to reduce the impact we may have on the external environment.

Furthermore, it is Optimarin's policy that all work performed shall meet legislative and contractual environmental requirements. To ensure that these requirements are met, Optimarin has introduced an applicable environmental control system, which is well documented.

A comprehensive introduction and overview of the Environment Management System will be given to all employees, to ensure that they fully understand the Environmental Management System with its associated internal and external obligations. The management and employees are always required to follow and conform with the environmental control system, to ensure that the environmental requirements are fulfilled in everything that we do.

Continuous improvement of the Environmental Management System is a priority in order to enhance environmental performance.
